

# Using the Add Data Widget by *File* or *Search*

To add track files such as .GPX or .KML, click the **Add Data** widget button, then click on the **File** dialog, click File then Upload to add a file by look up, else drag and drop. Add as many file as you need, turn any you don't need, then click Done.

Rename your added layers if desired. To add a layer to the map, click the **+** circle button for each layer.

To remove an added layer, click the Trash button in the lower right corner of the screen. A combo box listing the one or more layers you added will appear. Click tap the layer to be removed and repeat if multiple layers are to be removed.

To add a layer from an external source by **keyword search**, in the Add Data dialog click the **Search** tab and enter a term for something of interest. In this example "Railroad Saddle Transportation" was used to locate a planned new trail in the Payette National Forest. Turn any added track or layer off and on through check boxes under a
